Not only did the cane toads have no real effect on controlling the cane beetles, the amphibians had very few predators.

Cane toads often eat from pet dishes that are left outside.

Another name for a cane toad is a marine toad.

Common name it got when it was used to control insects infestations on sugarcane plantations

Once a male attracts a female they mate as the female lays her eggs.

Cane toads live up to five to ten years in the wild.

*A group of toads is called a
knot.*
